Application for Backend Developer (.NET) Position

Dear Hiring Manager,

I am writing to apply for the Backend Developer (.NET) position on your team. As a Backend Developer specializing in designing, developing, and maintaining scalable, secure, and high-performance backend systems using C#, ASP.NET Core, Entity Framework Core, and SQL Server, I am excited about the opportunity to bring my backend engineering expertise and passion for clean, maintainable code to your organization.

In my current role as a Backend Developer / Full Stack Developer at Luxor Booking Tours, I design and build scalable RESTful APIs using ASP.NET Core, applying Clean Architecture and SOLID principles so the codebase remains testable and easy to extend. I have implemented JWT-based authentication and role-based authorization systems to secure application endpoints, and I regularly work with SQL Server to design, optimize, and query databases that support core business logic. I take an active role in code reviews, debugging, testing, and deployment, and I consistently look for opportunities to improve application performance, maintainability, and security.

Beyond my current role, I have applied these same practices to independent backend projects. I built scalable backend APIs for a Hospital Management System using ASP.NET Core Web API, Entity Framework Core, and JWT authentication, implementing role-based access control to manage patient records, appointments, and audit logging securely. I also developed the backend services for Farhetak, a wedding hall booking platform, designing relational database structures and business rules, and built booking and availability management APIs for a tour booking platform, focusing on backend workflow design and API performance.

What draws me most to backend development is the opportunity to solve real architectural and data problems: designing APIs that scale, structuring databases that stay performant as data grows, and building authentication and authorization systems that keep applications secure. I approach every project with a strong grounding in OOP, design patterns, and layered architecture, and I am eager to bring this mindset to a team where I can contribute to building reliable, well-engineered backend systems from day one.

I would welcome the opportunity to discuss how my experience in ASP.NET Core, C#, Entity Framework Core, and SQL Server can contribute to your engineering team. Thank you for considering my application, and I look forward to the possibility of speaking with you further.

Sincerely,

Ezz Abdelmoez Ahmed Mohamed
