Application for Desktop Application Developer Position

Dear Hiring Manager,

I am writing to apply for the Desktop Application Developer position on your team. As a Desktop Application Developer with hands-on experience designing, developing, and maintaining Windows desktop applications using C#, .NET, WPF, WinForms, and SQL Server, I am excited about the opportunity to bring my software engineering expertise and enterprise desktop development experience to your organization.

In my current role as a Desktop Application Developer at Estrategia Startup, I build and maintain business management systems using WPF and C#, applying MVVM architecture, dependency injection, and SOLID principles to keep the codebase scalable and maintainable. I design database-driven solutions that integrate SQL Server and Access databases, build reusable UI components and custom controls, and deliver reporting, inventory, sales, and management modules that support real business operations. I am comfortable owning a feature end to end, from software design and data binding through debugging, testing, and deployment.

Beyond my current role, I have built several independent enterprise desktop projects that reflect this same engineering approach. I developed a complete POS Management System in C# and WPF with MVVM architecture, Entity Framework Core, and SQL Server, covering inventory, sales, purchasing, and reporting modules. I also built a Restaurant Management System handling order management and billing workflows, and a Travel Agency Management System in WinForms and ADO.NET for booking, reservation, and financial tracking. Across these projects, I have used libraries such as Autofac, Mapster, and CommunityToolkit.Mvvm to keep desktop applications clean, testable, and easy to extend.

What draws me to desktop application development is the challenge of building software that is fast, reliable, and genuinely useful for the people running a business day to day. I take pride in writing well-structured, object-oriented code, applying clean architecture and layered design so applications remain maintainable as they grow, and I enjoy the problem-solving involved in optimizing performance and refining desktop UI for a smooth user experience.

I would welcome the opportunity to discuss how my experience in WPF, WinForms, C#, MVVM, and SQL Server can contribute to your engineering team. Thank you for considering my application, and I look forward to the possibility of speaking with you further.

Sincerely,

Ezz Abdelmoez Ahmed Mohamed
